

Week 12 Assignment (Arrays)

The program for week twelve is supposed to display ten numbers in dollar-cent format. Given an array of ten numbers, a function would iterate over the array and concatenate each number with its succeeding number. The output stream would add in a dollar sign before each pair of numbers and a decimal point between each number.

To test the program, the expected result had to match the actual results. The expected result was each number in dollar-cent format on its own line with the dollar signs and decimal points in their correct places.
